Abstract

Attribution conditions in Dimensional Human Field Theory (DHFT) govern reference, citation, and identification of derivative material.

These conditions establish requirements for attribution, representation, and distinction between canonical and derivative material.

Attribution conditions govern system reference and do not define system structure, admissibility, or system use conditions.

I. Field Context

Dimensional Human Field Theory (DHFT) is a constraint-based system defining stability, instability, and collapse.

The system is defined by three invariant variables:

- Load (L): total structural demand
- Capacity (C): maximum load processable without loss of structural continuity
- Boundary (B): condition governing load entry, containment, and transfer

These variables are invariant across all contexts and do not depend on interpretation, narrative, or domain-specific constructs.

DHFT is a closed explanatory system.

II. Purpose

Attribution conditions define:

- attribution requirements
- representation conditions
- identification of derivative material

Enforce attribution integrity.

III. Global Constraint

All references to DHFT must:

- preserve authorship attribution
- identify the system by name
- distinguish between canonical and derivative material

Failure constitutes non-admissible representation.

IV. Attribution Requirement

All references to DHFT require:

- attribution to Cara Tonucci
- reference to canonical source material

Attribution must be explicit and non-ambiguous.

V. Representation Condition

DHFT may be:

- cited
- referenced
- discussed

DHFT shall not be:

- represented as authored by another party
- presented without attribution

Any such representation constitutes non-admissible representation.

VI. Derivative Identification

Derivative material includes:

- applications
- representations of system use
- extensions external to canonical definition

All such material must be explicitly identified as derivative.

Derivative material:

- does not constitute DHFT
- does not modify system structure
- does not alter canonical definitions

Attribution establishes reference, not equivalence.

Derivative material remains structurally distinct from DHFT.

VII. Non-Authorization

Attribution does not grant:

- authority to teach DHFT as canonical
- authority to certify use or understanding
- authority to modify system structure
- authority to represent derivative material as canonical

Attribution does not confer authorship or system equivalence.

VIII. Canonical Statement

All references to DHFT require attribution.

Derivative material remains structurally distinct from the canonical system.

Attribution does not confer authorship or system equivalence.

IX. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical notes.

X. Copyright

This document is an original work of authorship.

No part of this publication shall be reproduced, distributed, or transmitted in any form or by any means without prior written permission, except for brief quotations for academic or scholarly use.

This work defines original structural models and associated terminology within Dimensional Human Field Theory (DHFT).
