Abstract

The canonical source structure in Dimensional Human Field Theory (DHFT) defines the classification of materials and the distribution of authority across the system.

Authority is assigned exclusively to canonical sources and is independent of system exposure, application, or representation.

Canonical source structure governs system authority and does not define system structure, admissibility, or system use conditions.

I. Field Context

Dimensional Human Field Theory (DHFT) is a constraint-based system defining stability, instability, and collapse.

The system is defined by three invariant variables:

- Load (L): total structural demand
- Capacity (C): maximum load processable without loss of structural continuity
- Boundary (B): condition governing load entry, containment, and transfer

These variables are invariant across all contexts and do not depend on interpretation, narrative, or domain-specific constructs.

DHFT is a closed explanatory system.

II. Purpose

Canonical source structure defines:

- canonical material
- non-canonical material
- distribution of authority across sources

Establishes authority conditions governing system definition.

III. Global Constraint

Only canonical documents define DHFT.

Non-canonical materials do not constitute system definition.

Representation of system definition from non-canonical sources constitutes non-admissible representation.

IV. Canonical Material

Canonical materials include:

- DOI-registered DHFT publications
- designated DHFT technical notes
- official system repository records

Canonical materials:

- define system structure
- define invariant variables and relations
- establish admissible system descriptions

Canonical sources may include multiple language instantiations.

Each designated instantiation constitutes a structurally equivalent canonical representation of DHFT.

V. Non-Canonical Material

Non-canonical materials include:

- commentary
- applications
- representations of system use
- informal publications

Non-canonical materials:

- do not define system structure
- do not establish system admissibility
- do not modify canonical definitions

VI. Authority Distribution

Authority resides exclusively in canonical sources and includes:

- system definition
- structural relations
- admissible descriptions

No derivative or external material holds authority over system definition.

System authority is fixed at the level of canonical designation.

Authority does not vary with distribution, adoption, or interpretation.

VII. Version Condition

Canonical documents may be updated through formal publication.

Updated versions supersede prior versions.

The most recent canonical version constitutes the authoritative system definition.

VIII. Source Hierarchy Constraint

Canonical status is defined by formal designation, not by:

- visibility
- distribution
- citation frequency
- institutional adoption

System authority is independent of exposure, distribution, or adoption.

Authority relationships among canonical sources are defined in *Canonical Source Authority and Hierarchy in DHFT*.

IX. Canonical Statement

DHFT is defined exclusively through canonical documents.

Non-canonical materials do not constitute system definition.

System authority resides in formally designated canonical sources.

X. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (*L*), Capacity (*C*), and Boundary (*B*).

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical notes.

XI. Copyright

This document is an original work of authorship.

No part of this publication shall be reproduced, distributed, or transmitted in any form or by any means without prior written permission, except for brief quotations for academic or scholarly use.

This work defines original structural models and associated terminology within Dimensional Human Field Theory (DHFT).
