Abstract

Versioning and canonical stability in Dimensional Human Field Theory (DHFT) govern conditions under which canonical representations are updated while preserving structural invariance.

Canonical stability requires invariant system variables and structural relations.

Versioning applies to representation only and does not modify system structure.

I. Field Context

Dimensional Human Field Theory (DHFT) is a closed explanatory system defined over invariant variables:

- Load (L)
- Capacity (C)
- Boundary (B)

These variables and their structural relationships are non-modifiable.

DHFT is defined within Structural Stability Science (SSS) and derived through Structural Identification Method (SIM).

II. Versioning Scope

Versioning applies to:

- canonical representations
- technical notes
- formal expressions of system structure

Versioning does not apply to:

- invariant variables
- structural relations
- system classification

III. Canonical Stability Constraint

Canonical stability requires:

- invariance of system variables (L , C , B)
- invariance of structural relations
- preservation of dependency ordering

Revision of representation does not modify system structure.

Canonical stability applies across all designated language instantiations.

IV. Revision Classification

Revisions are classified as:

- **clarification:** refinement of expression without structural change
- **extension:** addition of constrained representation consistent with system invariance
- **reissuance:** replacement of prior canonical representation

No revision:

- redefines system variables
- alters structural relations
- modifies system classification

Any such modification constitutes a non-DHFT system.

V. Version Supersession

Canonical representations may be superseded through formal reissuance. The most recent canonical representation is authoritative. Prior representations remain part of the canonical record.

Supersession does not modify system structure.

VI. Non-Equivalence of Version and System

The following equivalence is non-admissible:

version $\neq$ system

Versioning applies to representation.
The system is defined by invariant structure and is not versioned.

VII. Constraint on Divergence

Multiple representations that differ in structure do not constitute versions.

Only structurally invariant representations are admissible.

Structural divergence constitutes non-admissible representation.

VIII. Enforcement Condition

Canonical versioning is enforced through:

- designation of authoritative representations
- validation of structural invariance
- identification of non-admissible divergence

Versioning does not introduce or modify system variables.

IX. Canonical Statement

DHFT is defined by invariant structure and is not subject to versioning.

Versioning applies exclusively to canonical representation and preserves structural invariance.

X. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical notes.

XI. Copyright

This document is an original work of authorship.

No part of this publication shall be reproduced, distributed, or transmitted in any form or by any means without prior written permission, except for brief quotations for academic or scholarly use.

This work defines original structural models and associated terminology within Dimensional Human Field Theory (DHFT).
