Abstract

Derivative and non-derivative classification in Dimensional Human Field Theory (DHFT) govern the conditions under which representations are identified as system-consistent, derivative, or non-DHFT.

Classification requires preservation of invariant variables and structural relations. Derivative status applies to representation and does not modify system structure.

I. Field Context

Dimensional Human Field Theory (DHFT) is a closed explanatory system defined over invariant variables:

- Load (L)
- Capacity (C)
- Boundary (B)

These variables and their structural relationships are non-modifiable.

DHFT is defined within Structural Stability Science (SSS) and derived through Structural Identification Method (SIM).

II. Classification Scope

Classification applies to:

- representations of DHFT
- applications derived from system use
- external materials referencing system structure

Classification does not apply to:

- invariant variables
- structural relations
- canonical system definition

III. Non-Derivative Condition

A representation is non-derivative only if it preserves:

- invariant variables (L , C , B)
- canonical definitions
- structural relations
- dependency ordering

Non-derivative representations constitute DHFT.

IV. Derivative Condition

A representation is derivative if it:

- applies DHFT within a specific context
- extends representation without altering structure
- maintains reducibility to (L , C , B)

Derivative representations:

- do not constitute DHFT
- do not modify system structure
- do not alter canonical definitions

V. Non-DHFT Condition

A representation is not DHFT if it:

- redefines system variables
- alters structural relations
- introduces additional system-level variables
- modifies dependency ordering

Any such representation constitutes a distinct system.

VI. Non-Equivalence Constraint

The following equivalences are non-admissible:

derivative $\neq$ system

application $\neq$ definition

representation $\neq$ structure

Classification is defined by invariant structure and not by use, context, or description.

All The Way Up (ATWU) is an application under constraint of DHFT and does not constitute system definition.

VII. Attribution Independence

Attribution does not define classification.

Attribution may be present in derivative or non-DHFT representations.

Absence of attribution does not establish non-derivative status.

Classification is independent of attribution.

VIII. Constraint on Misclassification

Misclassification occurs when:

- derivative representations are presented as DHFT
- non-DHFT systems are represented as DHFT
- system classification is inferred from application or exposure

Misclassification constitutes non-admissible representation.

IX. Enforcement Condition

Classification is enforced through:

- validation of structural invariance
- identification of structural deviation
- application of classification constraints

Classification does not modify system structure.

X. Canonical Statement

DHFT is defined by invariant variables and structural relations.

Derivative and non-derivative classification requires preservation of system structure.

No representation that alters invariant structure constitutes DHFT.

XI. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.
