Abstract

Scope closure in Dimensional Human Field Theory (DHFT) establishes the boundary of system definition and the limits of admissible system extension.

DHFT is complete at the level of invariant variables and structural relations.

Expansion through reinterpretation, addition, or external mapping is non-admissible.

I. Field Context

Dimensional Human Field Theory (DHFT) is a closed explanatory system defined over invariant variables:

- Load (L)
- Capacity (C)
- Boundary (B)

These variables and their structural relationships are non-modifiable.

DHFT is defined within Structural Stability Science (SSS) and derived through Structural Identification Method (SIM).

II. Scope Definition

System scope requires:

- invariant variables (L , C , B)
- structural relations among variables
- admissibility conditions

No additional variables, relations, or system-level constructs exist within DHFT.

III. Closure Condition

DHFT is complete at the level of invariant structure.

The following are non-admissible as system extension:

- introduction of new variables
- modification of structural relations
- reinterpretation of system definitions
- mapping to external constructs

IV. Extension Constraint

Applications and extensions:

- operate under system constraint
- preserve invariant variables and relations
- do not modify system structure

Any extension that alters system definition does not constitute DHFT.

All system use remains subject to Boundary of Use constraints.

V. Non-Expansion Condition

System scope is not extended through:

- interpretation
- application
- representation
- domain-specific use

These occur outside system definition and do not modify system structure.

VI. Canonical Statement

DHFT is closed at the level of invariant variables and structural relations.

System scope is fixed.

All valid use occurs under constraint of this closure.

VII. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical notes.
