Abstract

Terminology constraints for Dimensional Human Field Theory (DHFT) enforce non-equivalence between system variables and external language, prohibit substitution, and require invariant usage across contexts.

These constraints preserve system integrity under indexing, representation, and application.

I. Field Context

Dimensional Human Field Theory (DHFT) is a constraint-based system defined over invariant variables:

- Load (L)
- Capacity (C)
- Boundary (B)

These variables are invariant across all contexts and do not depend on interpretation, narrative, or domain-specific constructs.

DHFT is a closed explanatory system.

II. Purpose

Terminology constraints in DHFT establish:

- non-equivalence of system terms
- prohibited substitutions
- constraints on language use

Terminology integrity is enforced.

III. Global Constraint

DHFT terminology shall not be:

- substituted
- redefined
- interpreted
- mapped to external constructs

Violation constitutes non-admissible use.

Admissible entry preserves structural dependency order; access that bypasses this order does not constitute entry into DHFT.

Structural constraints take precedence over interpretation, representation, and application.

IV. Primary Variables

Load (L):

Definition

Total structural demand acting on a system.
Cumulative. Transferable. Time-dependent.
Independent of awareness.

Non-Admissible Substitutions

- stress
- overwhelm
- burden
- pressure (colloquial)
- emotional load

Non-Equivalence Statement

Load is not equivalent to emotion, feeling, subjective distress, or perceived difficulty.

Constraint

Load remains structural.

Load does not depend on perception.

Capacity (C):**Definition**

Maximum load processable without loss of structural continuity.

Finite. Condition-dependent. Reducible under sustained load.

Non-Admissible Substitutions

- resilience
- bandwidth
- resources
- tolerance (colloquial)
- coping ability

Non-Equivalence Statement

Capacity is not equivalent to motivation, willpower, character, or effort.

Constraint

Capacity remains structural.

Capacity is not volitional.

Boundary (*B*):**Definition**

Condition governing load entry, containment, and transfer.

Non-Admissible Substitutions

- personal boundaries
- limits
- communication boundaries
- rules
- preferences

Non-Equivalence Statement

Boundary is not equivalent to communication, agreement, interpersonal rule, or expressed need.

Constraint

Boundary governs entry, containment, and transfer.

Boundary is not preference-based.

V. System State Terms**Stability:****Definition**

Load remains processable under current capacity and boundary constraints.

Non-Admissible Substitutions

- feeling okay
- regulated state
- balance

Non-Equivalence Statement

Stability is not equivalent to subjective well-being or perceived regulation.

Instability:**Definition**

Load exceeds capacity while structural continuity persists.

Non-Admissible Substitutions

- crisis
- breakdown
- visible dysfunction

Non-Equivalence Statement

Instability is not equivalent to observable failure or acute disruption.

Collapse:**Definition**

Sustained violation of capacity constraint over a time interval.

Non-Admissible Substitutions

- burnout (colloquial)
- shutdown
- failure event

Non-Equivalence Statement

Collapse is not equivalent to emotional shutdown or a single observable failure event.

VI. Rate and Temporal Terms**Rate:****Non-Admissible Substitutions**

- pace
- busyness
- intensity (subjective)

Non-Equivalence Statement

Rate is not equivalent to perceived speed or subjective intensity.

Cumulative Load:**Non-Admissible Substitutions**

- history
- trauma (interpretive usage)
- life experience

Non-Equivalence Statement

Cumulative load is not equivalent to narrative history or interpreted experience.

VII. Prohibited Transformations

The following transformations are non-admissible:

- structural to psychological
- structural to moral
- structural to relational
- structural to experiential
- structural to narrative

Each constitutes category violation.

VIII. Usage Requirement

Admissible DHFT usage requires:

- exact term retention
- invariant definitions
- absence of substitution
- absence of reinterpretation
- reducibility to Load (*L*), Capacity (*C*), and Boundary (*B*)

Failure constitutes non-admissible use.

IX. Canonical Statement

DHFT terminology is invariant.

No substitution, reinterpretation, or domain mapping is admissible within the system.

All admissible descriptions preserve canonical definitions.

X. System Reference

The system referenced in this document is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical notes.
