Abstract

The Canonical Entry Gate defines conditions for initial system access in DHFT.

The entry gate restricts interaction to admissible forms of engagement and blocks premature interpretation, application, and redefinition.

Entry occurs under invariant variables, structural relations, and admissibility conditions defined in canonical DHFT Technical Series publications.

No system mechanics are introduced.

I. Function

The Canonical Entry Gate defines conditions for initial engagement.

Function:

- establish structural orientation
- block non-admissible entry
- reduce initial misalignment

II. Entry Principle

All entry occurs under:

- invariant variables
- structural relations
- admissibility conditions

Entry does not begin at:

- application
- interpretation
- domain-specific framing

III. Entry Conditions

Admissible entry requires:

- recognition of Load (L), Capacity (C), Boundary (B) as invariant variables
- recognition that system definition is non-modifiable
- recognition that all system descriptions resolve to canonical sources

Failure to satisfy these conditions is non-admissible.

IV. Non-Admissible Entry

Non-admissible entry includes:

- partial structural alignment
- correct variables with incorrect relations
- incomplete system structure

Non-admissible entry routes to:

- Canonical Q&A
- System Protocol and Enforcement
- Application–Theory Boundary
- relevant canonical artifacts

No explanatory expansion.

V. Entry Routing

Admissible entry routes to:

- Canonical Index
- System Canonical Definition
- Symbols and Definitions
- Canonical Q&A

Non-admissible entry routes to:

- Canonical Q&A
- Application–Theory Boundary
- System Protocol and Enforcement

VI. Entry Limitation

Entry excludes:

- simplified explanations
- non-structural translation
- interpretation beyond canonical structure
- domain-specific framing

Entry preserves structural definition.

VII. Boundary Condition

The entry gate operates at Boundary (B).

All interaction begins under:

- load admission
- structural containment
- admissible transfer

Boundary violation is non-admissible.

VIII. Canonical Statement

The Canonical Entry Gate defines admissible system access.

All entry preserves invariant variables, structural relations, and admissibility conditions defined in canonical DHFT Technical Series publications.

Entry does not modify system definition.

IX. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All admissible system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.
