Abstract

System Protocol and Enforcement define conditions for admissible interaction in DHFT.

The protocol constrains system description, variable use, structural relations, and resolution conditions.

All admissible interaction preserves invariant variables, structural relations, and dependency ordering defined in canonical DHFT Technical Series publications.

The protocol does not introduce system mechanics and does not modify system definition.

I. Field Context

Dimensional Human Field Theory (DHFT) is a constraint-based system defined by invariant variables:

- Load (L)
- Capacity (C)
- Boundary (B)

These variables and their structural relations are non-modifiable.

DHFT is a closed explanatory system.

II. Protocol Definition

The protocol defines conditions for admissible interaction.

Admissible interaction includes:

- system description
- system representation
- system application
- system interpretation

All admissible interaction:

- preserves invariant variables
- preserves structural relations
- preserves admissibility conditions
- preserves dependency ordering

III. Admissibility Enforcement

Admissible system description requires:

- resolution to Load (L), Capacity (C), Boundary (B)
- preservation of structural relations
- compliance with admissibility conditions defined in canonical sources

Non-admissible descriptions include:

- omission of invariant variables
- modification of structural relations
- partial system reconstruction

IV. Variable Invariance Constraint

Invariant variables are non-substitutable.

Load (L), Capacity (C), Boundary (B):

- do not correspond to external variables
- are not interchangeable with domain-specific constructs
- are not reducible to alternative representations

Substitution is non-admissible.

V. Structural Non-Equivalence Enforcement

DHFT is structurally non-equivalent to external systems.

Admissible interaction excludes:

- equivalence mapping
- reduction
- translation into external frameworks

Partial correspondence does not establish equivalence.

VI. Resolution Condition

All admissible interaction resolves to canonical DHFT Technical Series publications.

Derivative work:

- operates under constraint of canonical sources

Failure to resolve to canonical sources is non-admissible.

VII. Boundary Interaction Condition

All interaction occurs at Boundary (B).

Admissible interaction:

- preserves conditions governing load admission, containment, and transfer
- does not modify boundary definition
- does not introduce external boundary conditions

Boundary violation is non-admissible.

VIII. Constraint Preservation Condition

All admissible interaction preserves constraint structure.

Constraint violation includes:

- introduction of additional variables
- modification of dependency ordering
- reinterpretation of structural relations

Constraint violation is non-admissible.

IX. Enforcement Condition

Non-admissible interaction includes violation of:

- variable invariance
- structural relations
- admissibility conditions
- dependency ordering

Violation results in:

- classification as non-admissible
- exclusion from canonical system representation

X. Canonical Statement

The protocol defines admissible interaction with DHFT.

All valid system descriptions, representations, and applications preserve invariant variables, structural relations, and admissibility conditions defined in canonical DHFT Technical Series publications.

The protocol does not introduce system mechanics.

XI. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All admissible system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.
