Abstract

Governance in Dimensional Human Field Theory (DHFT) establishes the authority structure, decision rights, and constraints governing modification, extension, and representation of the system.

Governance operates as a structural function required to preserve invariant system integrity over time.

Governance does not define system mechanics.

I. Field Context

Dimensional Human Field Theory (DHFT) is a closed explanatory system defined over invariant variables: Load (L), Capacity (C), and Boundary (B).

These variables and their structural relationships are non-modifiable.

DHFT is defined within Structural Stability Science (SSS) and derived through Structural Identification Method (SIM).

Governance operates at the system boundary and does not define system mechanics.

II. Purpose

Governance defines:

- authority over system definition
- constraints on modification and extension
- admissibility of system-level claims
- institutional role in enforcement

It prevents unauthorized alteration, reinterpretation, or reclassification of DHFT.

III. Governance Scope

Governance applies to:

- system definition
- variable integrity
- structural relationships
- classification of DHFT
- admissibility of derivative material

Governance does not apply to:

- individual interpretation
- informal discussion
- non-referential use

Governance applies uniformly across all canonical language instantiations.

IV. Authority Structure

The Somatic Rising Institute is the governing body responsible for:

- maintaining canonical system definitions
- enforcing admissibility constraints
- evaluating claims of extension or application
- preserving system integrity across contexts

Authority is defined by structural admissibility.

No external entity may:

- redefine system variables
- modify structural relationships
- reclassify DHFT

Structural constraints govern all system use and take precedence over interpretation, representation, and application.

Institutional authority enforces constraints and does not supersede them.

Canonical authority is defined through designated canonical sources.

V. Non-Modifiability of Core System

The following are non-modifiable:

- Load (L), Capacity (C), Boundary (B)
- structural relationships governing stability
- dependency order ($SIM \rightarrow SSS \rightarrow DHFT$)
- classification as a closed explanatory system

Any modification constitutes a non-DHFT system.

All valid system operations, representations, classifications, and uses require satisfaction of admissibility conditions.

VI. Conditional Extension

An extension is admissible only if it:

- preserves invariant variables
- preserves structural relationships
- does not introduce additional system-level variables
- does not redefine existing variables

Extensions describe applications and do not modify system mechanics.

Application Reference Clause

All The Way Up (ATWU) is an application under constraint of DHFT.
It is classified as an application and does not constitute system definition.

VII. Representation Constraints

All representations must:

- preserve invariant definitions
- preserve structural relationships
- prohibit substitution with domain-specific constructs at the system level

Representation does not confer authority.

VIII. Institutional Role

The Somatic Rising Institute enforces governance constraints as the governing body of DHFT.

The Institute:

- enforces admissibility conditions
- maintains canonical documents
- evaluates structural compliance

Institutional action does not modify system structure.

IX. Violation Conditions

The following constitute violations:

- redefinition of variables
- alteration of structural relationships
- classification based on application or interface
- presentation of modified systems as DHFT

Violation results in non-admissible representation and terminates classification as DHFT.

X. Canonical Statement

DHFT is defined by invariant structure.

System validity is defined by structural admissibility.

Governance enforces structure and does not define it.

Versioning applies to documents, not the system.

XI. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical notes.

XII. Copyright

This document is an original work of authorship.

No part of this publication shall be reproduced, distributed, or transmitted in any form or by any means without prior written permission, except for brief quotations for academic or scholarly use.

This work defines original structural models and associated terminology within Dimensional Human Field Theory (DHFT).
