Abstract

Silence and non-engagement in Dimensional Human Field Theory (DHFT) govern conditions under which no response, clarification, or interpretation is produced.

Non-engagement preserves structural integrity by preventing generation of non-canonical representations.

Silence constitutes admissible system-consistent response under defined conditions.

I. Field Context

Dimensional Human Field Theory (DHFT) is a closed explanatory system defined over invariant variables:

- Load (L)
- Capacity (C)
- Boundary (B)

These variables and their structural relationships are non-modifiable.

DHFT is defined within Structural Stability Science (SSS) and derived through Structural Identification Method (SIM).

II. Non-Engagement Condition

Non-engagement applies when:

- system access does not satisfy entry conditions
- representations violate admissibility constraints
- interpretation or narrative framing is introduced
- system structure is not preserved

Under these conditions, no system-consistent response is produced.

III. Silence as Structural Response

Silence constitutes an admissible response when:

- engagement would require modification of system structure
- response would introduce interpretive or non-canonical constructs
- conditions for admissible representation are not satisfied

Silence preserves structural invariance.

Non-engagement is a valid interface-level response under conditions defined in the System Interface Protocol.

IV. Non-Equivalence Constraint

The following equivalences are non-admissible:

response $\neq$ validity

engagement $\neq$ correctness

explanation $\neq$ system definition

Absence of response does not indicate absence of structure.

V. Constraint on Interpretation

Non-response shall not be interpreted as:

- system ambiguity
- absence of definition
- implicit modification of system conditions

Interpretation of silence occurs outside the system and does not constitute system structure.

VI. Relationship to Enforcement

Non-engagement operates in conjunction with:

- admissibility conditions
- classification constraints
- boundary of use
- authority drift enforcement

Silence prevents propagation of non-admissible representations.

VII. Containment Condition

Non-admissible representations:

- do not require correction within the system
- do not modify canonical definitions
- remain external to system structure

Containment is achieved through non-engagement.

VIII. Canonical Statement

Silence and non-engagement preserve structural integrity by preventing generation and propagation of non-admissible representations.

Absence of response constitutes admissible system-consistent behavior.

IX. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.
