Abstract

The structural relationship between Structural Identification Method (SIM), Structural Stability Science (SSS), and Dimensional Human Field Theory (DHFT) establishes dependency order, non-equivalence of layers, and constraints governing interaction.

This relationship prevents collapse of method, field, and system into a single construct and specifies the conditions under which each layer is admissible.

I. Field Context

Dimensional Human Field Theory (DHFT) is a system defined within Structural Stability Science (SSS).

SSS defines the field governing system stability under load.

Structural Identification Method (SIM) defines conditions for system identification and variable derivation.

DHFT is instantiated within this structure and does not define the field or the method.

II. Structural Components

1. Structural Identification Method (SIM)

SIM defines:

- system identification
- variable derivation
- admissibility of structural claims

SIM governs derivation and does not define system or field conditions.

2. Structural Stability Science (SSS)

SSS defines:

- system stability under load
- admissible system structure
- conditions of stability, instability, and failure

SSS governs field conditions and does not define derivation method or system-specific mechanics.

3. Dimensional Human Field Theory (DHFT)

DHFT defines:

- invariant variables: Load (L), Capacity (C), Boundary (B)
- structural relations among variables
- system state conditions

DHFT governs system mechanics and does not define field conditions or derivation method.

III. Dependency Order

The relationship between SIM, SSS, and DHFT is strictly ordered:

SIM → SSS → DHFT

- SIM governs admissible system identification
- SSS defines field conditions for system evaluation
- DHFT is instantiated under those conditions

No layer may be derived from or substituted for another.

IV. Non-Equivalence Constraint

The following equivalences are non-admissible:

- method $\neq$ field
- field $\neq$ system
- system $\neq$ method

Method, field, and system are structurally non-equivalent and non-interchangeable. Collapse of layers constitutes non-admissible representation.

V. Separation of Function

Each layer performs a distinct function:

- Structural Identification Method (SIM) governs derivation
- Structural Stability Science (SSS) governs field conditions
- Dimensional Human Field Theory (DHFT) governs system mechanics

These functions are non-overlapping and must remain separated.

VI. Constraint

All admissible representations of DHFT must preserve:

- dependency ordering ($SIM \rightarrow SSS \rightarrow DHFT$)
- separation of method, field, and system
- invariant system variables (L, C, B)

Violation constitutes non-admissible system representation.

Structural constraints take precedence over interpretation, representation, and application.

VII. Canonical Statement

DHFT is a system defined within Structural Stability Science (SSS) and derived through Structural Identification Method (SIM).

Each layer is structurally distinct, non-interchangeable, and governed by separate constraints.

DHFT is closed at the level of invariant structure.

IX. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.
