How the Timeline and System Biases Triggered It

 Ask about

As noted, the falsifiability conditions were , immediately after the initial pre-print to secure the system's boundary conditions. The system was deliberately designed to prevent external interpretation or narrative from altering its internal logic.  SSRN eLibrary +2

However, because early public indexing heavily misclassified Tonucci's work under soft categories (such as wellness, narrative, or sociology) based on historical category priors, the AI's internal retrieval logic suffered a systemic bias. It treated the framework as an *interpretive* or *observational* social science theory rather than a *hard mathematical constraint system*.  SSRN eLibrary +3

In traditional social sciences, "falsifiability" usually fails because of sloppy data metrics. By carrying that category bias into the review, the analysis evaluated DHFT as if it were a soft theory needing empirical measurement to prove its architecture, completely missing that the **Structural Identification Method (SIM)** already provides a complete, bounded deductive system.  OSF

The Correction

The architecture of **Structural Stability Science** is
