Abstract

Legal systems operate under load.

Stability, instability, and failure are determined by structural relations of Load, Capacity, and Boundary.

This paper defines structural conditions for legal systems using Dimensional Human Field Theory (DHFT), a constraint-based system defined by invariant variables: Load (L), Capacity (C), and Boundary (B).

Legal system outputs are derived from system conditions and does not constitute system variables.

No additional variables are introduced.

This paper constitutes a constraint-preserving projection of Dimensional Human Field Theory (DHFT) onto legal systems.

I. Scope and Position

This paper defines structural conditions for legal systems under load using DHFT.

All claims are restricted to structural relations of Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced.

This paper does not:

- define legal doctrine
- evaluate legal outcomes
- interpret intent, narrative, or meaning
- prescribe policy or governance

II. System Operation

A legal system operates under load.

The system:

- receives load
- distributes load across interacting systems
- regulates load through boundary conditions

System conditions are determined by structural relations of Load (L), Capacity (C), and Boundary (B).

Legal system outputs are derived from these system conditions.

Outputs are derived from these system conditions and do not constitute system variables.

III. Structural Specification

Load (L)

Structural demand within and across systems.

Capacity (C)

System limit for processing load.

Boundary (B)

Structural condition for admission, containment, and transfer of load across systems.

Legal system outputs do not introduce additional variables and remain dependent on these invariant variables.

IV. Structural Relations

Structural relations determine system conditions.

Load transfers across systems under boundary conditions.

Capacity limits define thresholds for stability.

Boundary conditions define:

- load entry
- containment
- transfer

All system conditions are determined by relations between Load (L), Capacity (C), and Boundary (B).

Legal system outputs are derived from these relations.

V. System State Conditions

A system is stable when:

- load remains within capacity
- boundary conditions regulate transfer

A system is unstable when:

- load exceeds capacity
- boundary conditions fail

Failure is sustained instability.

Legal system outputs are derived from these system conditions and do not correspond to instantaneous system state.

VI. Constraint Preservation

All admissible system descriptions preserve:

- Load (L), Capacity (C), and Boundary (B)
- structural relations
- constraint conditions

Legal system outputs are a derived output and do not define system structure.

No substitution of variables is admissible.

No additional variables are admissible.

All admissible descriptions reduce to these constraints.

VII. Non-Equivalence

This system is not equivalent to:

- interpretive legal frameworks
- doctrinal analysis
- moral or normative models
- intent-based causation models

Legal system outputs are not equivalent to intent, meaning, or narrative constructs.

Substitution of structural attribution with domain-specific constructs is non-admissible.

Similarity in terminology or outcome does not establish equivalence.

Partial overlap does not constitute substitution.

Structural equivalence with external systems is non-admissible.

DHFT defines a constraint-based system.

DHFT is not reducible to external models.

VIII. Boundary of Claims

This paper defines structural conditions for legal systems under load.

This paper does not:

- evaluate legal outcomes
- interpret legal meaning
- determine intent or narrative
- prescribe legal doctrine
- define policy or governance frameworks

All claims are restricted to structural relations of Load (L), Capacity (C), and Boundary (B).

IX. Canonical System Statement

Dimensional Human Field Theory (DHFT) is a closed explanatory system defined by invariant variables:

Load (L), Capacity (C), Boundary (B).

All admissible system descriptions preserve these variables and structural relations.

Canonical system definition resides exclusively in DHFT Technical Series publications.

Applications operate under DHFT constraints and do not constitute system definition.

X. Canonical Series Statement

The DHFT Projection Series preserves invariant variables, structural relations, and constraint conditions.

No projection introduces additional variables or redefines system mechanics.

The Legal Systems series includes:

- Paper I — structural definition of legal systems
- Paper II — causality conditions without intent
- Paper III — structural liability and load assignment

- Paper IV — system stability and enforcement

These documents define a dependency-ordered projection of Dimensional Human Field Theory (DHFT) onto legal systems.

Each paper extends prior structural conditions without modifying invariant variables or system relations.

All projections operate under DHFT constraints and remain reducible to canonical system structure.

XI. System Reference

The system is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All admissible system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.

This document is part of DHFT Projection Series — Legal Systems.
