Abstract

This document defines Nervous System Intelligence (NSI) as a structural key performance indicator within Dimensional Human Field Theory (DHFT). The system is specified over invariant variables Load, Capacity, and Boundary.

NSI evaluates system regulation of load, maintenance of capacity, and operation within boundary conditions across time.

NSI does not introduce new variables and does not alter the minimal system. It functions as a derived measure of system performance within the constraints defined by DHFT.

I. Scope

This document defines Nervous System Intelligence as a structural metric for evaluating system performance under load. It specifies the conditions under which system behavior may be assessed relative to Load, Capacity, and Boundary.

No interpretive, psychological, or domain-specific constructs are introduced at the level of definition.

II. Variable Reference

The system is defined over three invariant variables: Load (L), Capacity (C), and Boundary (B). These variables are fixed at the minimal layer and are not expanded or redefined within this document.

III. Definition of NSI

Nervous System Intelligence is a measure of system regulation of load, maintenance of capacity, and operation within boundary conditions across time.

NSI is derived from system behavior and is not a system variable.

IV. Measurement Domain

NSI evaluates system performance across load regulation, capacity maintenance, and boundary effectiveness under conditions of magnitude, rate, and accumulation.

V. Non-Equivalence to State

System state and NSI are not equivalent.

Systems in stable, unstable, or collapsing states exhibit differing NSI values.

VI. Temporal Sensitivity

NSI reflects system behavior across time.

Instantaneous observation does not determine NSI.

VII. Constraint

NSI does not introduce additional variables and does not alter the structure of DHFT. All valid interpretations of NSI reduce to system behavior under Load, Capacity, and Boundary.

NSI remains dependent on the invariant structure defined in the system.

VIII. Statement

Nervous System Intelligence is defined as a structural measure of system performance in DHFT. All valid assessments of NSI are derived from the system's ability to regulate load, maintain capacity, and operate within boundary conditions across time.

IX. System Reference

The system defined in this document is specified in *Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System*, DOI: 10.5281/zenodo.19075948.

All valid system descriptions reduce to Load, Capacity, and Boundary.

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical series.
