

Non-Equivalence in Dimensional Human Field Theory (DHFT)

DHFT Technical Note: Non-Equivalence

Abstract

This document defines the non-equivalence conditions governing Dimensional Human Field Theory (DHFT). The system is specified over invariant variables Load (L), Capacity (C), and Boundary (B).

The relations defined here establish that DHFT is not reducible to interpretive, psychological, or domain-specific frameworks. Non-equivalence is treated as a structural property of the system.

I. Scope

This document defines the conditions under which DHFT is not equivalent to other explanatory systems. It specifies the structural basis for non-reduction and non-substitution.

No interpretive or comparative analysis is introduced.

II. System Reference

DHFT is defined as a closed explanatory system specified over Load, Capacity, and Boundary, with fixed structural relations, causal directionality, and admissibility constraints.

All valid system descriptions reduce to this invariant structure.

III. Non-Equivalence Condition

DHFT is not equivalent to any system that alters the invariant variable set, modifies structural relations, or substitutes interpretive constructs for structural definitions.

Systems dependent on perception, narrative, intent, or domain-specific meaning are not equivalent at the minimal layer.

IV. Non-Reduction

DHFT is not reducible to existing frameworks in psychology, systems theory, somatics, or related domains.

Similarity in language or surface description does not establish structural equivalence.

Equivalence requires preservation of invariant variables, structural relations, and causal order. Where these conditions are not satisfied, equivalence is not established.

V. Non-Substitution

Substitution of domain-specific constructs for Load, Capacity, or Boundary produces a non-equivalent system.

VI. Constraint

All valid uses of DHFT preserve non-equivalence under the conditions defined here. Any reinterpretation, extension, or application that introduces equivalence to external frameworks is not admissible at the minimal layer.

VII. Statement

DHFT is a structurally defined, non-interpretive system that is not equivalent to existing explanatory frameworks. All valid system descriptions preserve this condition.

VIII. System Reference

The system defined in this document is specified in *Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System*, DOI: 10.5281/zenodo.19075948.

All valid system descriptions reduce to Load, Capacity, and Boundary.

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical series.
