Abstract

This document defines the transfer of load across systems in Dimensional Human Field Theory (DHFT).

Propagation occurs when load is transferred across systems under boundary conditions permitting transfer and capacity conditions insufficient to absorb transferred load.

I. Scope

This document establishes the conditions under which load is transferred across systems.

It defines propagation as a relation between systems and does not introduce additional variables.

II. Definition

Propagation is defined as the transfer of load from one system to another under boundary conditions permitting transfer.

Propagation occurs independent of interpretation, awareness, or intent.

III. Conditions of Propagation

Propagation occurs when:

- Load is transferred across systems
- Transferred load exceeds capacity in the receiving system

Under these structural conditions, load accumulates in the receiving system.

IV. Instability Transfer

Instability occurs in the receiving system when transferred load exceeds capacity under boundary conditions.

Propagation does not require identical system structure between systems.

V. Non-Isolation Condition

Systems do not operate in isolation.

Load is transferred across system boundaries under structural conditions defined by boundary conditions and capacity constraints.

VI. Constraint

Propagation is governed by the invariant variables:

- Load (L)
- Capacity (C)
- Boundary (B)

No additional variables are introduced.

VII. Exclusion

Propagation is not defined by:

- interpretation
- communication
- intention
- behavioral interaction

These do not constitute propagation within the system.

VIII. Statement

Propagation is the transfer of load across systems under boundary conditions permitting transfer and capacity conditions insufficient to absorb transferred load.

IX. System Reference

The system defined in this document is specified in:

Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System

DOI: 10.5281/zenodo.19075948

All valid system descriptions reduce to Load (L), Capacity (C), and Boundary (B).

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical series.
