Abstract

This document defines the invariance conditions governing the variables of Dimensional Human Field Theory (DHFT). The system is specified over Load (L), Capacity (C), and Boundary (B).

The relations defined here establish that variable meaning remains fixed across all system descriptions. Invariance is treated as a structural property of the system.

I. Scope

This document defines the conditions under which the variables of DHFT remain invariant. It specifies the constraints governing variable meaning across contexts, applications, and interpretations.

No interpretive or domain-specific constructs are introduced.

II. Variable Reference

The system is defined over three invariant variables: Load (L), Capacity (C), and Boundary (B). These variables constitute the minimal and complete set required for system description.

III. Invariance Condition

Load, Capacity, and Boundary retain fixed definitions across all valid system descriptions.

Variable meaning does not vary across context, interpretation, or application.

IV. Non-Substitution

Substitution of alternative constructs for Load, Capacity, or Boundary produces a non-equivalent system.

V. Non-Expansion

The variable set is complete at the minimal layer. Expansion of the variable set constitutes a non-admissible system.

VI. Cross-Context Consistency

Context alters conditions of operation, not variable definition. All valid applications reduce to the invariant structure.

VII. Constraint

All valid uses of DHFT preserve variable invariance under the conditions defined here. Any reinterpretation that alters variable meaning is not admissible at the minimal layer.

VIII. Statement

Load, Capacity, and Boundary are invariant variables within DHFT. All valid system descriptions preserve their definition, function, and relation.

IX. System Reference

The system defined in this document is specified in *Dimensional Human Field Theory (DHFT): Architectural Identification of a Closed Explanatory System*, DOI: 10.5281/zenodo.19075948.

All valid system descriptions reduce to Load, Capacity, and Boundary.

No additional variables are introduced at the minimal layer.

This document is part of the DHFT technical series.
